Module: `biztech_website_megamenu` **Version:** 20.0.0.0 (Odoo 20) **Author:** AppJetty

1. Introduction

Advance Mega Menu turns an ordinary website menu item into a full-width dropdown panel that can display eCommerce categories, website pages, or both — with images, colours, icons and a footer bar.

The module adds its settings directly to the existing **Website Menu** form, so there is no separate app or menu to learn. Any menu that sits under a website's top menu can be converted into a mega menu by ticking one checkbox.

Six layouts are available, covering category-driven navigation, page-driven navigation, and combinations of the two.

2. Key features

- Six mega menu layouts, selectable per menu item.
- 2, 3 or 4 column category layouts.
- Multi-level category display, including sub-sub-categories.
- Page mega menus that nest website menus three levels deep.
- Per-menu background colour or background image.
- Per-menu icon beside the menu label.
- Custom colours for main categories and sub-categories.
- Optional footer bar across the bottom of the panel.
- Category image slider with a configurable label and position.
- Static promotional image with description text, left or right.

3. Prerequisites

- Odoo 20.0 with the **Website** and **eCommerce** apps installed. The module declares `depends: ['website_sale', 'website']`.
- An administrator account.
- At least one eCommerce category tree for the category-based layouts (**Website → eCommerce → Categories**).
- No extra Python packages are required.

4. Installation

1. Copy the `biztech_website_megamenu` folder into a directory listed in your `addons_path`.
2. Restart the Odoo service. **This step is required** — Odoo loads module Python from disk only at process start, so updating a module without restarting will not pick up new code.

   ```
   odoo-bin --addons-path=<your addons path> -d <database> --http-port=<port>
   ```

3. Log in as administrator and enable developer mode: **Settings → General Settings → Developer Tools → Activate the developer mode**.

4. Go to **Apps**, click **Update Apps List**, then **Update**.
5. Remove the default *Apps* filter, search for **Advance Mega Menu**, and click **Install** (or **Activate**).

5. Creating your first mega menu

Go to **Website → Configuration → Menus**. The list shows every website menu, with an **Is megamenu...?** column.

Step 1 — Create the menu

Click **New** and fill in:

Field	Value
Website	Leave blank to apply to all websites, or pick one.
Menu	The label shown in the navigation bar, e.g. `Shop by Category`.
Url	`/` is fine — the label opens a panel rather than navigating.
Parent Menu	**Required.** Choose the website's top menu, e.g. *Top Menu for Website 1*.

> **Important:** the mega menu options stay hidden until **Parent Menu** is set. A top-level (root) menu cannot be a mega menu.

Step 2 — Turn it into a mega menu

Two checkboxes appear once the parent is set:

- **Odoo Megamenu?** — Odoo's own built-in mega menu. Leave unticked.
- **Appjetty Megamenu?** — tick this one.

Ticking either hides the other; a menu uses one system or the other, not both.

Step 3 — Choose the layout

A **General Setting** tab appears with **Megamenu View Type**, defaulting to *Category Megamenu*. Pick the layout you want — see section 6.

Changing this field automatically adjusts the related options (for example, selecting a pages layout switches the special feature to *Static image*), so set the view type **first**, then adjust the rest.

Step 4 — Add content

Depending on the layout, a **Category Configuration** tab, a **Pages Configuration** tab, or both appear. Fill in whichever is shown.

Step 5 — Save and check the site

Save, then open the website front end. The new label appears in the navigation bar; click it to open the panel.

6. The six mega menu types

View type	Content source	Configuration tab
Category Megamenu	`category_ids`	Category Configuration
List Category Megamenu	`category_ids`	Category Configuration
Pages Megamenu	child menus	*(none — uses the menu tree)*
Pages Megamenu Pro	`page_ids`	Pages Configuration
Pages Megamenu Pro Max	`category_ids`	Category Configuration
Pages & Category Megamenu	`category_ids` **and** `page_ids`	Both tabs

6.1 Category Megamenu

Categories laid out in 2, 3 or 4 columns, each parent category acting as a column heading with its children listed beneath. Supports a category image slider or a static promotional image.

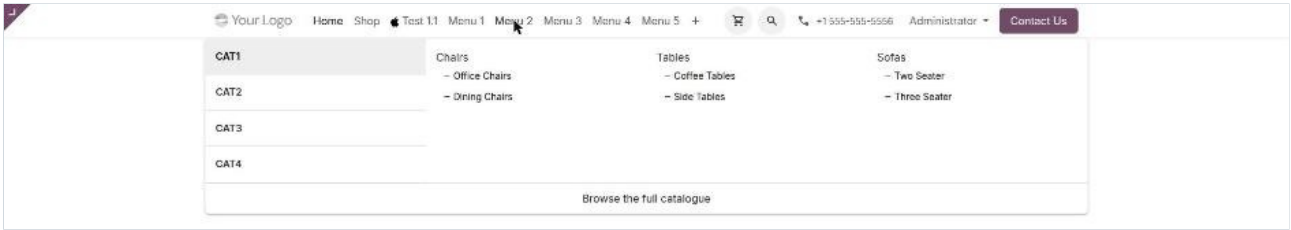

Typical configuration:

- **Megamenu type** — `3 Columns`
- **Special features** — `Category slider` or `Static image`
- **Slider label** — e.g. `Latest` (slider only)
- **Category slider position** — Left or Right
- **Category Configuration → Category** — the categories to show

6.2 List Category Megamenu

A two-pane layout: parent categories as a clickable list on the left, and the selected category's children in the right pane. Good for deep category trees.

The static image options are deliberately hidden for this layout.

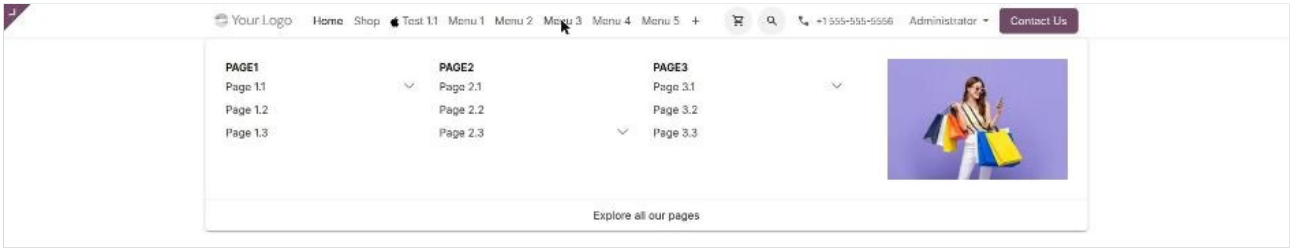

6.3 Pages Megamenu

Driven by the **menu tree** rather than a category field. Create child menus underneath the mega menu; each becomes a column heading, and its own children become the links in that column. A third level is supported and renders as an expandable item.

To build it:

1. Create the mega menu (e.g. `Menu 3`) and set the view type to *Pages Megamenu*.
2. Create further menus with **Parent Menu** set to `Menu 3` — these are the columns.
3. Create menus under those for the links.

> Core Odoo normally refuses a third menu level. This module relaxes that rule for menus inside a mega menu branch, so the deeper nesting is allowed here.

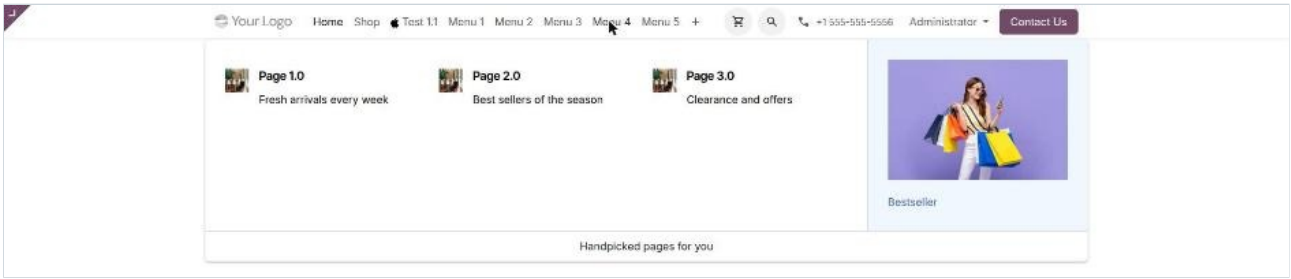

6.4 Pages Megamenu Pro

Page cards with an icon, a title and a description, plus a promotional image panel on one side.

Pages come from the **Pages Configuration → Pages** field, which selects existing website menu records. Per page, set on that menu record:

- **Display Icon** — the small image on the card
- **Description** — the line under the title

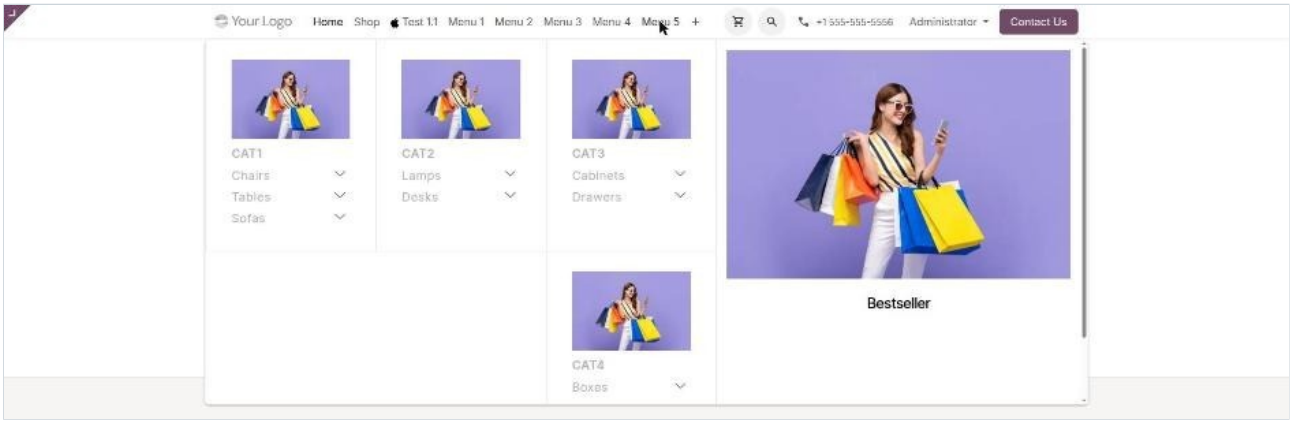

Static image is required for this layout. Tick **Add Static Image** and upload one, otherwise the record will not save.

6.5 Pages Megamenu Pro Max

Category cards showing each parent category's image above its child links, with a large promotional image panel alongside.

The **Megamenu type** (column count) field is hidden for this layout — the grid is fixed.

6.6 Pages & Category Megamenu

Combines both: categories and page links in a single panel, with a static image. Both the **Category Configuration** and **Pages Configuration** tabs are shown. As with Pro Max, the column-count field is hidden.

7. Configuration reference

All fields below are on the website menu form, **General Setting** tab, under **Configuration**.

Layout

Field	Notes
Megamenu View Type	Required. Hidden for Pro Max and Pages & Category: **Megamenu type**.
Megamenu type	`2 Columns`, `3 Columns` (default) or `4 Columns`.

Background

Field	Notes
Want to set megamenu background	Reveals the options below.
Megamenu background selection	`Background image` or `Background color`.
Background image for megamenu	Required when *Background image* is chosen.
Background color for megamenu	Required when *Background color* is chosen. Defaults to `#ccc` — set it explicitly, as the grey default rarely suits a site.

Menu icon

Field	Notes
Want to display menu icon	Shows a small image beside the label in the navbar.
Menu Icon	Required when the above is ticked.

Colours

Field	Notes
Want to customize menu colors	Reveals the two fields below.
Main category color	Required when ticked.
Sub category color	Required when ticked.

Footer

Field	Notes
Display menu footer	Adds a bar across the bottom of the panel.
Footer content	Rich text. **Required** once the above is ticked — saving fails if left empty.

Images and special features

Field	Notes
Add Static Image	Enables the promotional image panel.
Special features	`Category slider` or `Static image`. Shown for Category Megamenu only.
Slider label	Heading above the slider, default `Latest`.
Category slider position	Left or Right.
Static image position	Left or Right.
Static image	Required for *Pages Megamenu Pro*.
Static Image Description	Rich text under the image, e.g. `Bestseller`.
Display category image	Category Megamenu only — shows the main category image.
Category image display position	Top or Bottom.

Content tabs

Field	Notes
Category Configuration → Category	eCommerce categories to display.
Pages Configuration → Pages	Website menus to display as page cards.
